- Easily restore previous versions of critical documents.
- Clone the system disk: boot from an external disk if problems occur

System Requirements: Mac OS X 10.5, 10.6, or 10.7 • 50MB free hard drive space

Benefits of Backup Software

Backup software regularly copies your important files to a second form of storage media, such as an external hard drive or DVD-ROM. Since a backup ensures that two or more storage devices contain the same up-to-date files, using the software will help to keep data safe in case of computer failure. A backup should not be confused for an archive, which simply moves files from your computer or hard drive to another location for the purpose of creating a library. There are two key types of backup:

Full Backup - Backs up all selected files each time the backup job is run. This method guarantees the integrity of all your data, though it can take time and will require a good amount of disk capacity.
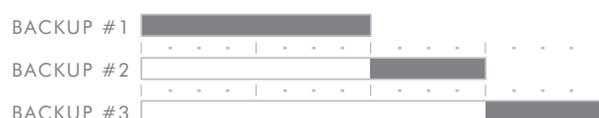

Incremental Backup - Backs up only the files that have changed since the last backup. Use this type of backup to save time and to conserve capacity on your storage device.
